It's broken down into different categories such as "Creative", "History", and "Art", each one having its own collection of examples and explanations. There are plenty of reasons why lenticular art has become very popular in modern times.

Lenticular images use two-dimensional imaging to simulate three dimensions through the illusion of depth perception. They can appear to change (morph) between two or more images. The most common method used is the alternate flashing between two contrasting images creating an illusion of motion, color variation or perspective change. A lenticular photograph is a picture that uses this method of printing. It contains two separate images that are printed on top of each other, thus creating the illusion of motion with one image between them. Along with depth perception, the images can also be used to create visual effects such as laying out different things for the viewer to see. A "lenticular-printed" is any photograph or image that contains lenticular effects, meaning various means are used to give the impression of motion. These forms include 3D through use of parallax, motion through alternating halves or sections, and color variation with time lapse photography.
